Alternaria & Other Molds

Mouse

An allergy is an exaggerated immune response to a substance. People and pets can be allergic to almost any substance. However, there are common allergens that a high percentage of allergy sufferers react to when exposed.

According to published medical reports one out of every five Americans suffers from allergies. These range from mold and pet dander allergies to pollen allergies and even allergic reactions to such common materials as latex.

According to the U.S. Department of Health & Human Services, millions of Americans also have allergic reactions to food allergens each year. The reactions can range from mild to severe and can even be life threatening. Since there are no cures for this type of allergy those that suffer from food allergies must avoid exposure.

Flour & Glutens
