Analytical Sensitivity 600x: 42 counts/cubic meter
Analytical Sensitivity 300x *: 13* counts/cubic meter
Skin Fragments: 1 1 to 4 (low to high)
Fibrous Particulate: 1 1 to 4 (low to high)
Background: 2 1 to 4 (low to high); 5 (overloaded)

No discernable field blank was submitted with this group of samples. ☑ Concentration at or below background ☀ Not commonly found growing indoors, spores likely come from outside.
Bipolaris++ = Bipolaris/Dreschlera/Exserohilum ☹ Concentration above background ☀☀ Spores reported to be able to cause allergies in individuals.
Myxomycetes++ = Myxomycetes/Periconia/Smut ☹☹ Concentration 10X or more above background ☀☹☹ Potential for mycotoxin production exists with these fungi.
☔ These fungi are considered water damage indicators.

Initial report from: 00/00/2021 13:25:10

High levels of background particulate can obscure spores and other particulates leading to underestimation. Background levels of 5 indicate an overloading of background particulates, prohibiting accurate detection and quantification. Present = Spores detected on overloaded samples. Results are not blank corrected unless otherwise noted. The detection limit is equal to one fungal spore, structure, pollen, fiber particle or insect fragment. *** Denotes particles found at 300X. "-" Denotes not detected. Due to method stopping rules, raw counts in excess of 100 are extrapolated based on the percentage analyzed. EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples received in good condition unless otherwise noted.
